exe Autocad 2013 installation is not compatible with Windows 7. I am trying to install Autocad 2013 for my new laptop. When I try to run the Autocad 2013 installation it gives me the following error: The Autocad 2013 installer encountered an error: This application cannot run on this computer. In the "Uninstall" window, I click on "Uninstall" but when I click on "Finish" in the "Uninstall" window, it shows me the following message: A required component is not installed or is not valid. I have tried the following: I uninstalled Autocad 2013 from my old laptop. I ran the Autocad 2013 installation on my new laptop and it worked fine. I installed Autocad 2013 from the Autocad 2013 CD. I installed Autocad 2013 from the Autocad 2013 DVD. I installed Autocad 2013 from the Autocad 2013 DVD and then used "Repair" to repair the Autocad 2013 installation. The "Repair" option in the Autocad 2013 DVD does not work. How can I fix this error? A: I have run into this before, where the installer is trying to run the application on the 32 bit version of Windows. Check your Autocad 2013 DVD and make sure that it is set to run on 64 bit Windows, or vice versa. The Autocad 2013 DVD should contain a folder called "Autocad2013-English-DVD-x64.exe". Q: Remove specific elements from a list based on a string list I have a list with elements that have many elements. For example, x = [{"a":"value1", "b":"value2"}, {"c":"value3"}, {"d":"value4"}] I have a list with a strings that contains the names of the elements I want to remove from the list x. For example, n = ["a", "b"] What is the most efficient way to remove the elements from the list x with the names from n? I tried x = x[x not in n] But it doesn't work, since the list n has a length of 2 and the list x has a length of 1000. You can use a list comprehension: >>> x = [{" 82157476af
